Data Centric Web Application's

Project Innovation/Extra Functionality:

Employees (MongoDB): Added extra feature where you can delete an employee.

Locations: Added a Locations list with all locations which you can delete and add location which has validation so duplicates can't be added with input validation so only correct information can be added.

Employee's Department: Added Employee's Department list with all the employees and their assigned departments, now you can update and change which department they are in which has validation so only existing departments can be assigned, with input validation so only correct information can be added.

Department: Now you add a new department, with validation so a valid Location ID needs to be inputted to create new department and there is also input box validations so only correct information can be added.

Employees: Now you can add employee with validation so unique ID needs to be inputted to create new user, Input boxes also have validation so only correct information can be added.
